
● **TRAXIM** New at NAB 2000

AN EDGE-FINDER KEY Now Available as a Discreet spark

- key objects which have not been blue or green screened.
- automate much of the tedium in roto applications.
- automatically make garbage mattes of moving objects which are changing size and shape.
- key one of several identically colored objects and follow it as it moves.

● **TRAXIM**, now available as a Discreet Logic spark, finds an object's edges and makes a matte of the object, tracking the edges frame after frame, even as the object changes size and shape.

Using quick and easy input from the effects artist, ● **TRAXIM** isolates any number of objects or picture elements instantly.

The Effects Artist simply uses a broad brush stroke to indicate each object of interest. ● **TRAXIM** uses Edge-Seeking Machine Vision Algorithms to find each object's edges and delivers either a matching outline, matte, or the isolated object itself.

● **TRAXIM** automatically tracks the object or objects creating a traveling matte. And the matte can be edited, sized, or softened.

The most time consuming, repetitive work in effects is now being automated by ● **TRAXIM**.

THE FIRST NEW WAY TO **ISOLATE** OBJECTS SINCE THE
INTRODUCTION OF THE CHROMA KEY.
AND IT'S **COLOR INDEPENDENT.**
